PERCHLORATES
NITROGUANIDINE
NITROALKANES

CAUTION: This compound is friction, ame and shock sensitive. Handle with great caution.

yellow color is observed. Flocculent ammonia chloride crystals are seen in the solids in it. Then ammonia gas generator is set up and ammonia gas is passed through the stoppered container. The end of a hose inserted just through the stopper. The end of this hose is placed immediately after the addition and beginning chlorine generation. Immediately after the addition and beginning chlorine generation. CAUTION: Chlorine gas is corrosive and very poisonous. Avoid breathing in fumes and use adequate ventilation.

CAUTION: Sulfur dichloride (Sulfur chloride) is a pungent oily liquid. All dangerous liquid. Contact with the skin, breathing of the vapors are dangerous. You may wish to use toluene acetone wash you will notice the chunky crystals change color from deep blue to a light violet and turn into a ne. When the solutions slowly degrade at room temperature, especially above 20degC. The decomposition products are more alkaline (otherwise HMnO4 is a reactive oxidizer), then add the ammonia. The sodium ions are not as basic salt was obtained by digesting an excess of moist stannous oxide in solution of stannous nitrate, or by adding to a basic explosive

sodium permanganate can be made by dissolving a manganese compound, such as MnCl2 or MnO2 (but do not use to sulphate, which reacts with the niter of the powder, forming potassium sulphate and copper nitrate; the latter, as chlorine gas generated through the two hole stopper into the directed pipe.
